## Description

## Technical Field

5 [0001] The present invention relates to novel quinazoline derivatives useful as medicament, more particularly to novel quinazoline derivatives having an action inhibiting the production of TNF- $\alpha$ , IL-4 and IL-5 and the pharmaceutically acceptable salts thereof.

## Background Art

10

[0002] TNF- $\alpha$  is a peptide consisting of 157 amino acids and having a molecular weight of about 17,000, and one of cytokines produced from various cells including macrophage. TNF- $\alpha$  was found at first as a cytokine which induced hemorrhagic necrosis in tumor portions, but through subsequent studies it has been made clear that its actions range not only over tumor cells but also over many normal cells and it shows a variety of activities. Examples thereof are antitumor activity through cytostatic and cytopathic effects against tumor cells, regulation of differentiation and multiplication through the induction of apoptosis, inhibition of the lipoprotein lipase activity of fat globules, development of HLA antigen of vascular endothelial cells and fibroblast, activation of neutrophil and generation of superoxide and so forth.

Of these functions, for example regarding inflammation, TNF- $\alpha$  acts on all the cells which are involved in inflammation, produces or induces cytokines, such as IL-6, IL-8 and GM-CSF, and cell adhesive molecules, such as ICAM-1, and plays a part in many phenomena observed at the time of inflammation, such as production and induction of, for example, prostaglandin E<sub>2</sub> and protease, cell differentiation and activation, bone resorption, and proliferation of synovial cells. And, it is understood as a cytokine which extensively participates in the biophylaxis through the immune reaction against inflammation (Masatoshi Yamazaki: Cytokine 94-From the basic to latest information-; Nippon Igaku Kan, 109-117 (1994), Vassalli, P., Ann. Rev. Immunol., 10, 411(1992)).

[0003] On the other hand, it has come clear that a continuous or excess production of TNF- $\alpha$ , in contrast with the above, acts on normal cells and causes various diseases. For example, it is reported that TNF- $\alpha$  is increased in the joint synovia and blood of rheumatoid arthritis patients (Tetta, C., Camussi, G., Modena, V., Vittorio, C. D., Baglioni, C., Ann. Rheum. Dis. 49, 665(1990)) and that in the clinical test using anti-TNF- $\alpha$  antibody this shows a remarkable effect (Elliott, M. J., Maini, R. N., Feldman, M., Kalden, J. R. et al., Lancet, 344, 1105(1994), Elliot, M. J., Maini, R. N., Feldman, M. et al., Lancet, 344, 1125(1994), E. C. C. Rankin, E. H. S. Choy, et al., British J. Rheum., 34, 334(1995)). Concerning the septic shock, too, TNF- $\alpha$  is one of causes thereof and it is reported that in the experiment using anti-TNF- $\alpha$  antibody this has an inhibitory effect (Starnes, H. F., Jr., Pearce, M. K., Tewari, A. et al., J. Immunol., 145, 4185 (1990), Beutler, B., Milsark, I. W., Cerami, A. C., Science, 229, 869(1985), Hinshaw, L. B., Tekamp-olson, P., Chang, A. C. K. et al., Circ. Shock, 30, 279(1990)). Further, the participation of TNF- $\alpha$  is suggested also regarding inflammatory bowel diseases such as ulcerative colitis and Crohn's disease (Murch, S., Walker-Smith, J. A., Arch. Dis. Child, 66, 561(1991), Masahiro Maeda, Digestive Organ and Immunity, 22, 111(1989)), and it is reported that in the clinical test in which anti-TNF- $\alpha$  antibody is used the effect is demonstrated (Hendrik, M. VanDulleman, Sander, J. H. VanDeventer, et al., Gastroenterology, 109, 129(1995)).

[0004] It is also suggested that the excess production of TNF- $\alpha$  plays a part in diseases such as osteoarthritis (Venn, G., Niefeld, J. J., Duits, A. J., et al., Arthritis Rheum., 36, 819(1993)), multiple sclerosis (Sharief, M. K., Hentges, R., N. Engl. J. Med., 325, 467(1991)), Behcet's disease (Akoglu, T., Direskeneli, H., Yazici, H., Lawrence, R., J. Rheumatol., 17, 1107(1990)), systemic lupus erythematoses (SLE)(Maury, C. P. J., Teppo, A.-M., Sharief, M. K., Arthritis Rheum., 32, 146(1989)), rejection at the time of the bone marrow transplantation (Nestel, F. P., Price, K. S., Seemeyer, T. A., Lapp, W. S., J. Exp. Med., 175, 405(1992)), hepatitis (Kozo Kanno, Liver, 33, 213(1992) and type II diabetes (Hotamisligil, G. S., Shargill, N. S., Spiegelman, B. M., Science, 259, 87(1993)).

[0005] Further, it is reported that, also in allergic diseases such as asthma, allergic dermatitis and allergic rhinitis, the excess production of TNF- $\alpha$  participates in the pathologic aggravation of the diseases (Shah, A., Church, M. K., Holgate, S. T., Clin. Exp. Allergy, 25, 1038(1995)). Particularly, in asthma, not only the excess production of TNF- $\alpha$  but also the excess production of IL-4 and IL-5 as cytokines plays a part of the worsening of the disease, and the presence of them is actually confirmed in the affected part of a patient (Hamid, Q. M., Azzawi, M., Sun Ying, et al., J. Clin. Invest., 87, 1561(1991), Bradding, P., Roberts, J. A., Britten, K. M., et al., Am. J. Respir. Cell. Mol. Biol., 10, 471 (1994)). IL-4 induces B cells to produce the IgE antibody and besides has a function of differentiating and multiplying the type 2 helper T-cell. The IL-5 has actions such as activation, differentiation and multiplication, and extension of life of eosinophilic leukocyte and plays an important role in allergic inflammation. Accordingly, it is considered that a therapeutic medicament which inhibits the excess production of not only TNF- $\alpha$  but also IL-4 and IL-5 is more desirable for improving the pathosis of asthma.

[0006] As mentioned above, it has become clear that the excess production of TNF- $\alpha$ , IL-4 or IL-5 adversely affects

the diseases above-mentioned, and there is desired research and development on a compound inhibiting the production of TNF- $\alpha$ , IL-4 and IL-5 as a therapeutic medicament for such diseases.

[0007] As the compounds which show an action of inhibiting the production of TNF- $\alpha$ , the followings are enumerated.

[0008] JP-A-10-130149 discloses that quinolone derivatives are useful as a TNF- $\alpha$  production inhibitor.

[0009] JP-A-11-1481 discloses that piperidinyolphthalazine derivatives are useful as a TNF- $\alpha$  production inhibitor.

[0010] Pentoxifylline having the 7-methylxanthine skeleton is known as a compound showing the production inhibitory action on TNF- $\alpha$  (Ward, A., Clissold, S. P., *Drugs*, **34**, 50(1987), Semmler, J., Gebert, U., Eisenhut, T., *Biochem. Biophys. Res. Commun.*, **155**, 1230(1988), Zabel, P., Schade, F. U., Schlaak, M., *Immunobiology*, **187**, 447(1993)).

[0011] Besides, as compounds or factors showing the action inhibiting the TNF- $\alpha$  production, there are known hitherto glucocorticoid, protease inhibitor, phospholipase A2 inhibitor, lipoxygenase inhibitor, PAF (platelet aggregating factor) antagonist and anti-TNF- $\alpha$  antibody. These compounds, however, may have side effects due to their various pharmacological actions, raising the problem regarding their use, and development of a safe drug having a new mechanism is longed for.

[0012] Meanwhile, many compounds are known which have the quinazoline skeleton. For example, there are mentioned the followings as quinazoline derivatives in which the 6-position has a nitro group or halogen atom and the 4- and 7-position have N-containing substituents.

[0013] *Journal of Medicinal Chemistry (J. Med. Chem.)*, **39**, 267(1996) describes that a 4-anilinoquinazoline derivative has an inhibitory action on phosphorylation of EGF receptors.

[0014] WO98/14431 discloses that quinazoline derivatives are useful as an inhibitor of phosphorylation of PDGF receptors.

[0015] WO98/08848 discloses that quinazoline derivatives are useful as synthetic intermediates for imidazoquinazoline derivatives which are useful as an inhibitor of cGMP-specific phosphodiesterases.

#### Disclosure of the Invention

[0016] The present invention provides a novel compound which has an inhibitory action on the production of TNF- $\alpha$ , IL-4 or IL-5 and which is useful for the treatment of diseases in which the continuous or excess production of TNF- $\alpha$ , IL-4 or IL-5 is considered to play a part in the start of the diseases, such as rheumatoid arthritis, septic shock, inflammatory bowel diseases, osteoarthritis, multiple sclerosis, Behcet's disease, systemic lupus erythematoses (SLE), rejection at the time of the bone marrow transplantation, hepatitis, type II diabetes, asthma, allergic dermatitis and allergic rhinitis, or provides a pharmaceutically acceptable salt thereof.

- 40 [0069] The intermediates and end products in the above-mentioned manufacturing methods can be isolated or purified by conventional methods. For example, they can be isolated or purified using neutralization, filtration, extraction, drying, concentration, recrystallization and various kinds of chromatography. The solvent for recrystallization includes, for example, alcohol solvent such as methanol, ethanol and 2-propanol, ether solvent such as diethyl ether, ester solvent such as ethyl acetate, aromatic hydrocarbon solvent such as toluene, ketone solvent such as acetone, hydrocarbon solvent such as hexane and mixed solvents thereof. It is also possible for the intermediates to be used in the next steps without any purification.

- 50 [0070] In case that a salt of the compound (1) is desired to be obtained, if the compound (1) is obtained in the form of a salt it is purified as it is, and if obtained in a free form it is dissolved or suspended in a suitable solvent and convert it into a salt by adding an acid. And, it is possible to transform the compound (1) obtained in the form of a salt into a free compound and then to convert it into the form of a desired salt.

- 55 [0071] Upon carrying out the above reactions, it is possible to use the techniques of protection and deprotection for functional group, which are described in detail in T. W. Green and P. G. M. Wuts, "Protecting Groups in Organic Synthesis", 1990.

- [0072] As the medicaments of the present invention there can be used substances selected from the group consisting of compounds represented by the general formula (1) and pharmaceutically acceptable salts thereof, or there can be

used hydrates or solvates thereof. It is also possible to use these substances in a proper combination of two or more. A substance per se selected from the group may be administered as a medicament of the present invention, but usually it is preferable to administer in the form of a medicament composition containing the above substance as an effective ingredient and pharmaceutically acceptable preparation additives.

[0073] The medicament composition applied for the living body can easily be produced according to the preparation methods commonly used in the field of pharmacology, that is, by mixing the above substance as effective ingredient and one or two or more kinds of pharmaceutically acceptable preparation additives. The administration route of the medicament of the present invention is not limited in particular, but it is preferable to properly choose the most effective route in the treatment and/or prevention. The medicinal composition suitable for oral administration includes, for example, capsules, powders, tablets, granules, fine grains, syrups, solutions and suspensions, and the medicament composition suitable for parenteral administration includes, for example, absorbents, nebulas, intrarectal administration medicaments, injections, drops, ointments, creams, transdermal absorbents, transmucosa absorbents, eyedrops, col-lunarium, eardrops, tapes and patches. The forms of the medicaments of the present invention, however, are not limited to these.

[0074] Of the medicinal compositions suitable for oral administration, liquid preparations such as emulsions and syrups can be manufactured using preparation additives such as water; saccharides such as saccharose, sorbit and fructose; glycols such as polyethylene glycol and propylene glycol; oils such as sesame oil, olive oil and soybean oil; antiseptics such as p-hydroxybenzoic acid ester; and flavors such as strawberry flavor and peppermint flavor. The solid preparations such as capsules, tablets, powders and granules can be manufactured using excipients such as lactose, glucose, saccharose and mannitol; disintegrating agents such as starch and sodium alginate; lubricants such as magnesium stearate and talc; binders such as polyvinyl alcohol, hydroxypropyl cellulose and gelatin; surfactants such as fatty acid ester; and plasticizers such as glycerol.

[0075] Of the medicament compositions suitable for parenteral administration, liquid preparations in the form of injections, drops and cyedrops can preferably be manufactured as sterilized isotonic liquid preparations. For example, the injections can be prepared using a salt solution, a glucose solution or an aqueous medium consisting of a mixture of salt water and glucose solution. The intrarectal administration agents can be prepared usually in the form of suppository using carriers such as cacao fat, hydrogenated fat and hydrogenated carboxylic acid. Further, for the preparation of the nebulas there can be used non-irritating carriers which disperse the above substance of the effective ingredient as fine particles to facilitate absorption. As such carriers, it is possible to enumerate lactose and glycerol and to select the forms of aerosol and drypowder as the form of the preparations. Further, in the production of the medicament compositions for parenteral administration, there can optionally be used one kind, or two or more kinds of preparation additives selected from diluents, flavors, antiseptics, excipients, disintegrating agents, lubricants, binders, surfactants and plasticizers which have been illustrated in the oral administration agents. The preparation additives used for the manufacture of the medicaments of the present invention are not limited to those mentioned above, and any can be used as long as it is utilizable for a person skilled in the art.

[0076] The dose and frequency of administration of the medicaments of the present invention are not limited in particular, and generally, in the case of oral administration, it is possible to administer a dose in the range of about 1 to about 1000 mg, preferably about 10 to about 500 mg per day for an adult in one portion or in several portions. In the case of administration as an injection medicament, the dose ranging about 0.1 to about 500 mg, preferably about 3 to about 100 mg can be administered in one portion or in several portions.

Example 145: TNF-α production inhibiting test using human PBMC (peripheral blood mononuclear cells)

Preparation of human PBMC

[0348] The blood of a healthy person was taken with a vacuum blood-collecting tube (Nipro neotube) and diluted up to two-fold with physiological saline (Otsuka Pharmaceuticals). To the diluted blood was added 6% dextran T-500 (prepared after dissolution in physiological saline (Otsuka Pharmaceuticals) and sterilization with an autoclave) so as to make a final concentration of 1%. The solution was subjected to tumble mixing and allowed to stand at room temperature for 30 minutes to precipitate the erythrocytes. The supernatant was collected and subjected to centrifugation at 20 °C and at 1,500 rpm for 10 minutes. The cells were suspended in 3 ml of RPMI1640 culture medium (Asahi Technoglas) and overlaid on the solution surface of 3 ml Lymphoprep (NYCOMED). Further, with 1.5 ml of RPMI1640 culture medium being added to the tube which had contained the cell suspension liquid, the cells attached to the tube, which had remained uncollected, were suspended for collection and overlaid on the Lymphoprep previously mentioned. This operation was repeated again. After centrifugation at 20 °C and at 2,000 rpm for 30 minutes, there was collected a fraction of peripheral blood mononuclear cells present in the boundary surface between the Lymphoprep and the RPMI1640 culture medium. The cells were washed twice with 10 ml RPMI1640 culture medium to remove the Lymphoprep and then suspended in a RPMI1640 culture medium added with 10% bovine fetal serum (IRVINE SCIENTIFIC), 100 U/ml penicillin and 100 μg/ml streptomycin (hereinafter referred to as cRPMI1640 culture medium). The number of the cells was measured by Tuerk dying, and the cells, after adjustment to 3 × 10<sup>6</sup> cells/ml, were planted in 100 μl well on a 96-well plate (FALCON). The cells were cultured at 37 °C under 5%CO<sub>2</sub> atmosphere for about 5 hours.

Induction of TNF- $\alpha$  production by LPS stimulus

[0349] LPS (E.coli 0111:B4, DIFCO), which had been prepared to 10 mg/ml with water and kept at -20, was diluted to 100  $\mu$ g/ml with cRPMI1640 culture medium and subjected to sterile filtration. The 100  $\mu$ g/ml LPS was diluted with cRPMI1640 culture medium to prepare 20 ng/ml LPS. A compound to be tested which was dissolved in DMSO at 1,000-fold concentration was diluted to 500-fold with cRPMI1640 culture medium containing 20 ng/ml LPS and added in 100  $\mu$ l/well to the cells which had been planted on the previously mentioned 96-well plate (final concentration of LPS: 10 ng/ml). For use as the control group, the solutions were made by diluting DMSO of the same volume as in the test compounds with cRPMI1640 culture medium containing 20 ng/ml LPS, and they were added to the cells. These cells were cultured at 37 °C under 5%CO<sub>2</sub> atmosphere for 16 hours.

Determination of TNF- $\alpha$  activity (ELISA method)

[0350] To the 96-well plate the mouse anti-human TNF- $\alpha$  antibody (prepared to 2  $\mu$ g/ml with Coating buffer\*<sup>1</sup>) was added so as to make 100  $\mu$ l/well and allowed to stand at 4 °C overnight. After 5-times washing with Wash buffer\*<sup>2</sup> (300 $\mu$ l/well), the Blocking buffer\*<sup>3</sup> was added to the solutions, which were allowed to stand 37 °C for 2 hours. The culture supernatants were diluted up to 5-fold in the plate (supernatant 20  $\mu$ l being added to 80  $\mu$ l of cRPMI1640 culture medium). Simultaneously, for using for a calibration curve, a series of dilution of recombinant human TNF- $\alpha$  was prepared and allowed to stand 37 °C for 1 hour. After 5-times washing with Wash buffer (300  $\mu$ l /well), biotinylated rabbit anti-human TNF- $\alpha$  antibody (prepared to 0.25  $\mu$ g/ml with Antibody diluent\*<sup>4</sup>) was added so as to make 100  $\mu$ l /well and allowed to stand at 37 °C for 1 hour. After 5-times washing with Wash buffer (300  $\mu$ l /well), Streptavidin-Horseradish peroxidase(prepared to 1:4000 with Antibody diluent) was added to make 100  $\mu$ l /well and allowed to stand at 37 °C for 15 minutes. After 5-times washing with Wash buffer (300  $\mu$ l /well), TMB microwell peroxidase substrate (KPL) was added to make 100  $\mu$ l /well and allowed to stand at room temperature for 10 minutes. Stop solution\*<sup>5</sup> was added to make 100  $\mu$ l /well. absorbance (A450nm)of each well was measured with a microplate reader, and then the data was processed with a Microplate Manager III (BIO-RAD). The human TNF- $\alpha$  activity was determined quantitatively according to the calibration curve from the recombinant TNF- $\alpha$ . The ELISA of human TNF- $\alpha$  mentioned above was conducted using human TNF- $\alpha$  duoset (genzyme). The residual activity of human TNF- $\alpha$  production of the test compound was determined according to the following formula.

[0351] Residual activity of human TNF- $\alpha$  production (%)=(human TNF- $\alpha$  activity in culture supernatants of the group added with the compounds)/(human TNF- $\alpha$  activity in culture supernatants of the group not added with the compounds)

- <sup>1</sup> Coating buffer: 0.1M carbonate, pH 9.4-9.8
- <sup>2</sup> Wash buffer: PBS, 0.05% Tween20 (PBS: Takara Shuzo)
- <sup>3</sup> Blocking buffer: 1% bovine serum albumin (BSA), PBS, pH 7.2-7.4 (BSA:SIGMA)
- <sup>4</sup> Antibody diluent: 1% BSA, 0.05% Tween20, PBS, pH7.2-7.4
- <sup>5</sup> Stop solution: 2NH<sub>2</sub>SO<sub>4</sub>

[0352] From the residual activity of human TNF- $\alpha$  production determined by the above formula, the inhibitory activity IC<sub>50</sub> was determined. The results are shown in Table 21.

Example 146: IL-4 and IL-5 production inhibiting test

[0353] A 6-weeks-old BALB/c-mouse (Nippon Charles River) was bred preparatively for 1 week and given at the day 0 and day 14 intraperitoneal injection of 100  $\mu$ l PBS to give immunity which PBS contained 0.1 mg/ml of Ovalbumin (OVA) and 40 mg/ml of aluminum hydroxide. At the day 21 the spleen was taken out from the mouse. The spleen was dissected with a *pincette* in cooled PBS, passed through a mesh and subjected to centrifugation at 4 °C at 1,500 rpm for 5 minutes. The cells was added with 5 ml of 0.2% NaCl to destroy erythrocytes, and then was made isotonic by

adding 5 ml of 1.6% of NaCl. After centrifugation at 4 °C, 1,500 rpm for 5 minutes, the cells were washed twice with 10 ml of RPMI1640 culture medium. The obtained spleen cells were suspended in cRPMI1640 medium, and the number of the cells was measured by Tuerk dying. After being adjusted to  $1 \times 10^7$  cells/ml, the cells were planted in 100  $\mu$ l/well on a 96-well plate (FALCON). The cells were cultured at 37 °C under 5% CO<sub>2</sub> atmosphere for about 4 hours.

OVA was prepared to 10 mg/ml with cRPMI1640 culture medium and subjected to sterile filtration. The 10 mg/ml OVA was diluted with cRPMI1640 culture medium to give 1 mg/ml OVA. A compound to be tested which was dissolved in DMSO in at 1,000-fold concentration was diluted up to 500-fold with cRPMI1640 culture medium containing 1 mg/ml OVA and added in 100  $\mu$ l/well to the cells which had been planted on the previously mentioned 96-well plate (final concentration of OVA: 0.5 mg/ml). As the controls, the solutions were made by diluting DMSO of the same volume as with the test compounds with cRPMI1640 culture medium containing 1 mg/ml OVA, and they were added to the cells. These cells were cultured at 37 °C under 5%CO<sub>2</sub> atmosphere for 3 days.

IL-4 and IL-5 in the culture supernatants after 3 days were quantitatively determined by ELISA method. IL-4 and IL-5 were quantitatively determined using IL-4 Development Kit (Genzyme Techne) and mouse IL-5 MiniKit (ENDOGEN), respectively. The production inhibiting rates of each tested compound against IL-4 are shown in Table 22, those against IL-5 in Table 23.
